GO Release notes

Dear GoWorkforce user,

Our latest software release is here! Several new features, improvements and bug fixes are implemented with our latest release. The implementation of the new software update is scheduled on 20-04-2022 between 20:00 and 21:00 (CEST). Because of this, your GoWorkforce environment may be (partly) inaccessible for a short time.

GO New Features

Active monitoring
We have added a new feature to the attendance page: an active monitoring widget. Users with a certain permission are able to see the picture of persons who are checking in at that given moment at an access control unit.

Pop-out card: Clicking on a picture shows a pop-out card with additional information about the check-in.

My timetracking
Every user can have access to their own timetracking through this new module, meaning they can see and export their own worked hours.

Tax Identification Number
A new entry field has been added into the identification details so a person can enter their Tax Identification Number.

GO Improvements

Storage of Data: Global - local
Due to GDPR regulations we migrated the storage of sensitive data around persons. As a result, most data, such as personal information and qualifications will only be stored locally and is only visible in the client environment.

Personal data: Updating any of the personal fields, including verifying or updating identification data through Keesing or Datachecker, in any client environment will not affect the data of the same fields in another client environment.

Current attendance filters
We have expanded the filters on the current attendees page with **zone** and **check-in before date**.

ACT365
We changed the minimum insert when searching a person by card to 1, so that an ACT365 card/tag can also be searched manually.

Person overview
Activation from is added as an extra column in the person overview

SCORM
GoWorkforce can now play SCORM 1.2 and 2004 files so the interactive content of these files can be opened within a site safety exam.

GO Bug fixes 🐞

Attendance page
Visitor's name on the attendance page redirects a user to the wrong profile **[Fixed]**

Pre-registration form
It is possible to select a **date last workday** earlier than **date first workdate** in the pre-registration form **[Fixed]**
